

PART B

You are Chris Ip. You have a blog called ‘Future Features’. You are writing a blog entry about what the world might be like in 2050. Write the blog entry describing some global issues, global improvements and innovations that might exist in 2050. Provide a title for your blog entry.

Earth in 2050

Earth in 2050 is a very controversial topic that is talked about often because people wonder and worry if the earth will become a better place. People have questions whether this earth will stay the same or worsen. We will talk about what may happen in the future.

Earth in 2050 is definitely going to look a lot more different than it is at the present. It will have a lot of global improvements rather than problems. We will have clean energy, better technology and most likely better medicines to treat the untreatable diseases at the moment.

The human being is rapidly developing its ways of understanding the world, which means there will be consensus on global issues. Overpopulation will be an issue in the future, because at some point we won't have energy, enough food and resources for everyone due to the rapidly rising population. Scientists are trying to produce and grow genetically modified foods and fortunately, they have succeeded. They are able to make a whole steak in the lab with just small drops of cow blood. Technology in 2050 will have a massive improvement. Artificial Intelligence is going to improve and will be made to serve the human race. The AI barley managed to make a low-quality videos of Will Smith eating a bowl of noodle in 2021, but in 2025, it can recreate videos perfectly with amazing quality. So imagine what AI can do in the future.

The year 2050 will also bring more problems for humans alongside improvements. People will misuse technology as a dangerous weapon, for hacking or even for nuclear wars, etc. There will also be other major issues like pollutions, global warming, things that will slowly kill our beautiful planet. So, to counter and tackle through these problems, humans will need to make new innovations. Innovations that will exist in 2050 are electric cars, flying taxis and so on.

The EVs will contribute to reduce air pollution because they don't emit toxic gases. And unlike normal cars which runs on gas, electric cars don't need gas. Sound proof barriers counters noise pollution. It can muffle loud noises, which can be helpful for construction sites. Genetically modified foods can be helpful for us in the future because soon we won't have enough food for the everyone, due to overpopulation.

What else do you think will happen in 2050? It's your turn!
